Online Retail — Data Quality Scorecard

Dataset: cleaned_online_retail.csv | Records: 536,641 | Columns: 8 | Generated: 24 Oct 2026

Dimension	Score	Finding / improvement recommendation
Completeness	96.82%	Percentage of non-missing cells. Does not distinguish optional from required fields. Recommendation: Review missing values and confirm which fields are mandatory.
Uniqueness	100.00%	Rows without exact duplicates. Repeated invoice numbers may be legitimate. Recommendation: Investigate duplicate transaction rows using a suitable business key.
Validity	99.34%	Selected quantity, price and date rules. Negative quantities may represent returns. Recommendation: Review negative quantities and prices; separate legitimate returns from errors.
Consistency	100.00%	Country formatting and date parseability. Only selected consistency checks are measured. Recommendation: Standardize country text and validate date and numeric formats.
Accuracy	100.00%	Unit-price validity proxy. True accuracy requires a trusted reference. Recommendation: Compare transaction values with a trusted reference source.
Timeliness	Not assessed	Not scored. No freshness SLA or ingestion timestamp. Recommendation: Define a freshness SLA and record data-ingestion timestamps.

Great Expectations: 5 of 8 original checks passed; 3 failed. Review flagged records before using the data for reporting.

Scoring note: Accuracy is represented only by a unit-price validity proxy. Timeliness is not scored because no agreed freshness SLA or ingestion timestamp is available. These are operational indicators, not a certified DAMA assessment.
